Functional Reconstruction of the Mandible: Experimental Foundations and Clinical Experience

Roland R. Schmoker

Functional Reconstruction of the Mandible: Experimental Foundations and Clinical Experience
Roland R. Schmoker
Since 1958 the Association for the Study of Internal Fixation (ASIF) has worked to establish the experimental and biomechanical prin ciples of the operative treatment of fractures. It has been proven that immediate, pain-free mobilization, made possible by stable internal fixation, is the key to restoring function in a fractured extremity. The same principles were applied in 1972173 by Roland Schmoker, who developed a universal plate and sophisticated instrument set designed initially for the treatment of comminuted fractures of the mandible. To extend the applications of his plate to reconstructions after ex tensive tumor resections, he supplemented the device with tem poromandibular joint prostheses and anchoring elements for the at tachment of dentures. He first tested the functional stability of these implants experimentally in sheep. Later he found that the minipig had a more human-like jaw shape and masticatory action, and so he tested the implants in 37 mini pigs that underwent extensive mandibular re sections without bone grafting, using sequential dye injections and postoperative weight gain to chart the progress of osseous regener ation. Seven other animals were not operated and served as controls.
